**Schuinsdrift moth traps**

- First graph indicates the original data received from the farmers.
- The second graph indicates the mean number of moths, while the dark blue arrows indicate the life cycles as forecasted by the average mean daily temperatures. Light blue arrow indicate the extension of lifecycle due to weather conditions
- The third graph includes the current climatic data as weekly total rainfall and weekly average temperature in relation to the mean moth number.
- The green blocks present the mean planting time and the yellow blocks the harvest time. The red block presents the critical time for presence of new moth activity.
- Moth peak numbers between week 21 and 28 could be responsible for moth flights during the critical period and probably larvae that could damage crop just before harvest.
- Table indicates the dates when larvae will be present (left) and when the new moth flights could happen.

### Koedoeskop moth traps

- First graph indicates the original data recieved from the farmers.
- The second graph indicates the mean number of moths, while the dark blue arrows indicate the life cycles as forecasted by the average mean daily temperatures. Light blue arrow indicate the extension of lifecycle due to weather conditions
- The third graph includes the current climatic data as weekly total rainfall and weekly average temperature in relation to the mean moth number.
- The green blocks present the mean planting time and the yellow blocks the harvest time. The red block presents the critical time for presence of larvae
- Moth peak from week 24 onwards could give rise to high moth numbers during the critical period.
- Table indicates the dates when larvae will be present (left) and when the new moth flights could happen.

## Beestekraal moth traps

- First graph indicates the original data recieved from the farmers.
- The second graph indicates the mean number of moths, while the dark blue arrows indicate the life cycles as forecasted by the average mean daily temperatures. Light blue arrow indicate the extention of lifecycle due to weather conditions
- The third graph includes the current climatic data as weekly total rainfall and weekly average temperature in relation to the mean moth number.
- The green blocks present the mean planting time and the yellow blocks the harvest time. The red block presents the critical time for presence of new moth activity.
- Current moth activity may result in high moth numbers in the critical period.
- Table indicates the dates when larvae will be present (left) and when the new moth flights could happen.
